Provide a detailed report that shows motivation of the results.

1

Let $f(y) = c(1 - y)$, $0 < y < 1$ be the density function of the random variable Y .

- a) Find c so that $f(y)$ is a density function. 1p
- b) Find the cumulative distribution function $F(y)$. 1p
- c) Find $E[Y]$. 1p
- d) Find $V[Y]$. 1p

2

Let the bivariate random variable (Y_1, Y_2) have joint density function:

$$f(y_1, y_2) = \begin{cases} 3y_1, & 0 \leq y_2 \leq y_1 \leq 1 \\ 0, & \text{elsewhere} \end{cases}$$

- a) Find the marginal distributions $f(y_1)$ and $f(y_2)$. Are y_1, y_2 independent? 2p
- b) Calculate $P(Y_1 \leq 1/2, Y_2 \leq 1/2)$. 1p
- c) Find $f(y_1|y_2)$ and use it to calculate $P(Y_1 \leq 3/4 | Y_2 = 1/2)$. 1p

3

Let Y_1, Y_2, \dots, Y_n denote n independent and identically distributed random variables from the following distribution with unknown parameter k ,

$$f(y|k) = \begin{cases} (k+1)y^k, & 0 < y < 1 \\ 0, & \text{elsewhere} \end{cases}$$

Estimate k using the Maximum Likelihood method.

- a) Find $E(Y_1 - 4Y_2 - Y_3)$. 1p
- b) Find $V(4Y_1 - 2Y_2 + Y_3)$. 1p

- a) Set up the simple linear regression model and estimate β_0 and β_1 . 2p
- b) Test if the slope is zero. You may use without showing any calculations that SSE=0,571. Use 5% significance level. Interpret your result. 1p
- c) Find a 90% confidence interval for $E[Y] = \beta_0 + \beta_1 x^*$ at $x^* = 5$. 1p

- a) Choose an appropriate prior distribution for θ , and use it to find its posterior distribution. 2p
- b) Find an expression for the estimator $\hat{\theta}_{Bayes}$. 1p
